Delayed gastric emptying (DGE) is a common complication following gastric bypass surgery. The modified Mayo score, which assesses the severity of a patient's co-morbid conditions, is a validated risk predictor for postoperative complications in patients undergoing general surgery. The purpose of this pilot study was to evaluate the modified Mayo score as a predictor of DGE following gastric bypass. In this retrospective review, the modified Mayo score, operative time and length of hospital stay of patients who underwent gastric bypass (1998-2006) were compared with those who experienced postoperative DGE. Patients who did not develop DGE by postoperative day 2 were compared with those who experienced DGE. DGE occurred in 23 of the 336 patients who underwent gastric bypass. The median operating time and length of hospital stay were significantly longer for patients who developed DGE compared with those who did not. The score was a significant independent predictor of DGE in this cohort ( $p = 0.037$ ). The modified Mayo score is a useful tool for predicting DGE following gastric bypass. This information can be used to alert physicians and patients of the potential complications of gastric bypass and can help identify patients for intervention, such as feeding tube placement, to prevent DGE. The semiconductor integrated circuit (IC) industry has experienced exponential growth. Technological advances in IC materials and design have produced generations of ICs where each generation has smaller and more complex circuits than the previous generation. In the course of IC evolution, functional density (i.e., the number of interconnected devices per chip area) has generally increased while geometry size (i.e., the smallest component (or line) that can be created using a fabrication process) has decreased. This scaling down process generally provides benefits by increasing production efficiency and lowering associated costs. Such scaling down has also increased the complexity of processing and manufacturing ICs and, for these advances to be realized, similar developments in IC processing and manufacturing are needed. For example, the need to perform higher resolution lithography processes grows. One lithography technique is extreme ultraviolet lithography (EUVL). Other techniques include X-Ray lithography, ion beam projection lith 0cc13bf012

Occult hepatitis B virus (HBV) infection refers to the presence of HBV DNA in the liver with undetectable serum HBV DNA levels. The long-term natural history of occult HBV infection remains largely unknown. Detection of the virally induced abnormality, known as hepatitis B e antigen (HBeAg), and the detection of high levels of serum HBV DNA is important in defining the natural history of occult HBV infection. Although levels of serum HBV DNA are routinely measured in the clinical management of chronic hepatitis B (CHB), levels of serum HBV DNA are not routinely measured in the evaluation of patients with occult HBV infection. Instead, a highly sensitive assay, quantitative polymerase chain reaction (qPCR), is being used to define the natural history of occult HBV infection. Based on recent research advances, the role of HBeAg-negative occult HBV infection in determining the natural history of CHB and the role of antiviral agents in HBeAg-negative occult HBV infection are reviewed. WASHINGTON (Reuters) - U.S. Secretary of State Rex Tillerson laid out on Friday an "ironclad" policy for his department under President Donald Trump, vowing to be "uncompromising" in the face of attempts to use U.S. power to impose U.N. sanctions on North Korea. When asked what action he would take if Pyongyang ignored U.S. demands, Tillerson replied: "We will apply our sanctions." "We will be uncompromising in our adherence to what we believe is the correct application of those sanctions," he told reporters during an annual press briefing at the State Department. Tillerson, who was flanked by his deputy Secretary of State, said he did not expect the U.N. Security Council to force Pyongyang to give up its nuclear
